Use ArcNLET to Estimate Nitrogen Load from Septic Systems to Indian River Lagoon (part of Main-South canal in Indian River County)

> Prepared by: Mohammad Sayemuzzaman and Ming Ye Department of Scientific Computing Florida State University

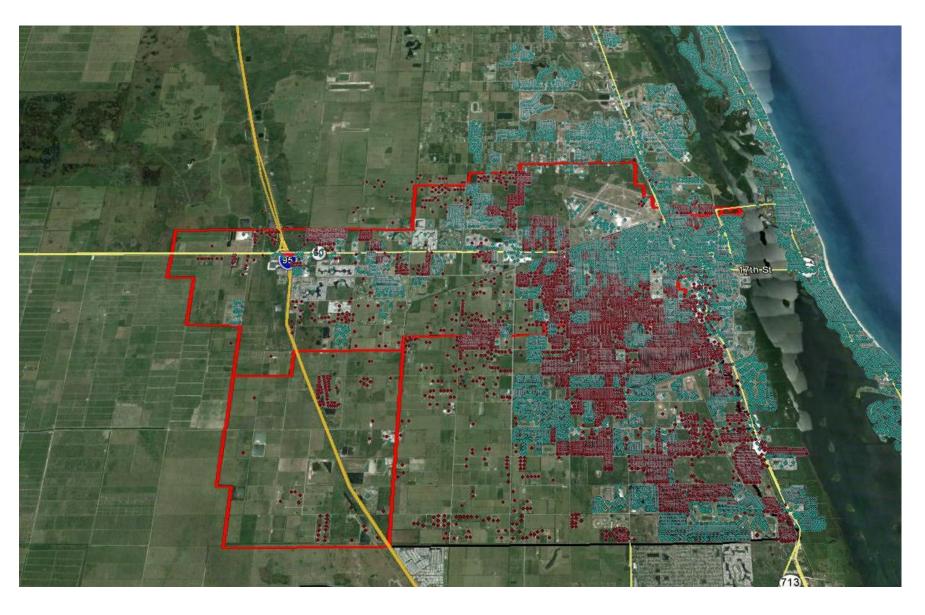

## Study Area: Main-South canal drainage basins of IRC

 The load estimates from the drainage basins can be used directly for TMDL implementation as well to help assess for future septic tank phase-out projects.

Figure 1.1. Location of Impaired Tributary Segments in the IRL Basin

## Septic tank locations

- No Sewer: **12,735**
- Converted to sewer:
   27,171
- Main Canal: 5343
  South Canal: 7392

Sources: Will Rice (IRC)

# Modeling Procedure

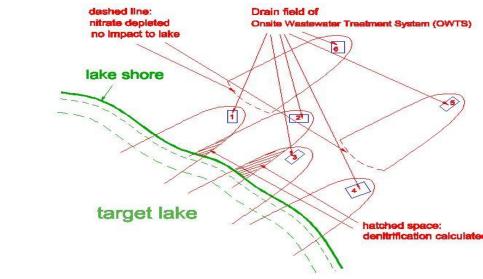

For each site, whenever site-specific data are available,

- Compile historical data to understand groundwater flow and nitrogen transport at the modeling sites.
- Select calibration data of hydraulic head and nitrogen concentration to estimate ArcNLET flow and transport model parameters.
- Calibrate the ArcNLET model.
- Simulate nitrogen transport at the modeling site, using the calibrated model.
- Estimate the nitrogen load.

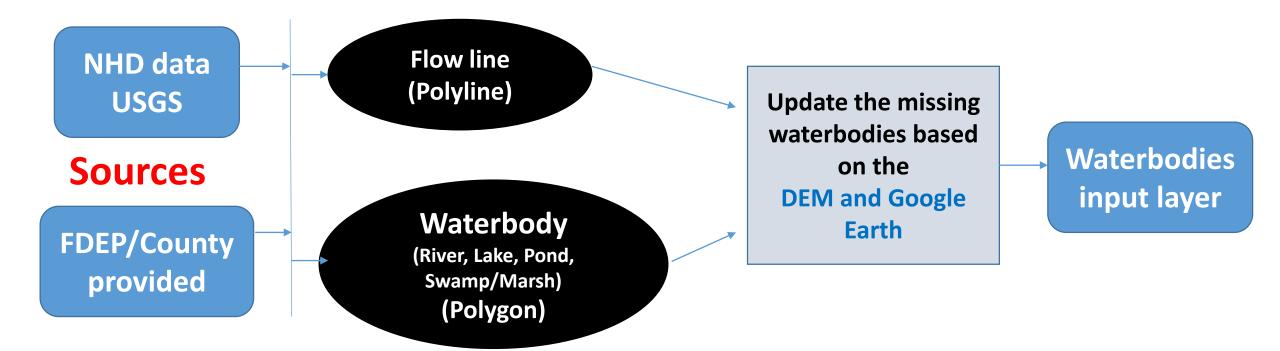

# Input Data of ArcNLET

All input data files are in ArcGIS format.

- Locations of septic tanks
- Locations of water bodies
- Topography (DEM: Digital Elevation Model): Process it to obtain water table
- Hydrogeological and transport parameters
  - Smoothing factor (used to process topography)
  - Hydraulic conductivity (from SSURGO)
  - Porosity (from SSURGO)
  - Dispersivity
  - Decay coefficient of denitrification
  - Source load and concentration

## Preparation of Input files (GW flow) : Waterbodies

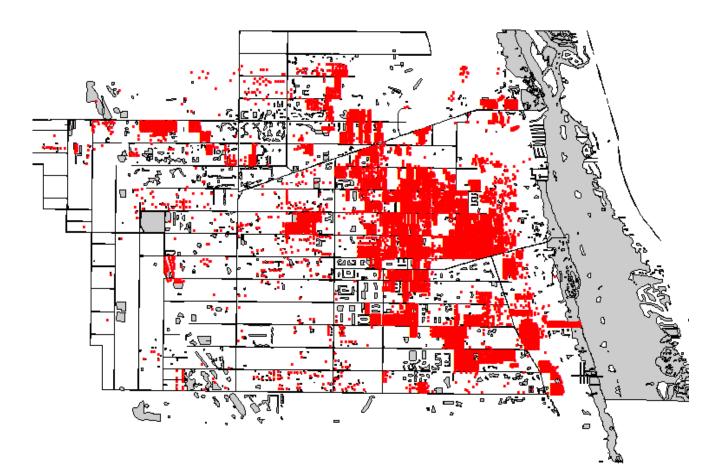

Preparation of Input files (GW flow) : **DEM (Digital Elevation Map)** 

## **Sources :**

-LiDAR (Light Detection And Ranging) DEM (5ft\*5ft or 15ft\*15ft) -NED (National Elevation Datasets) DEM (3m\*3m or 10m\*10m)

## Data sets: WaterBody (Canals, lagoon, lakes, swamps)

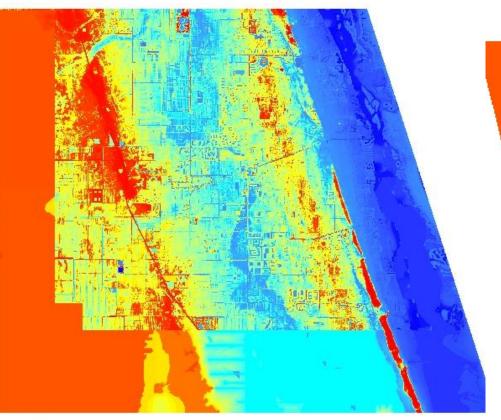

7

## Data sets:

### SSURGO: soil data

### Lidar DEM

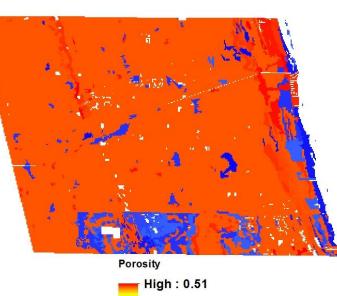

#### DEM (m)

High : 17.268

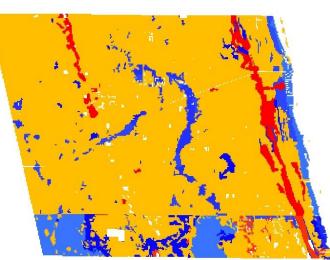

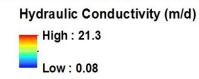

### Porosity

Low : 0.34

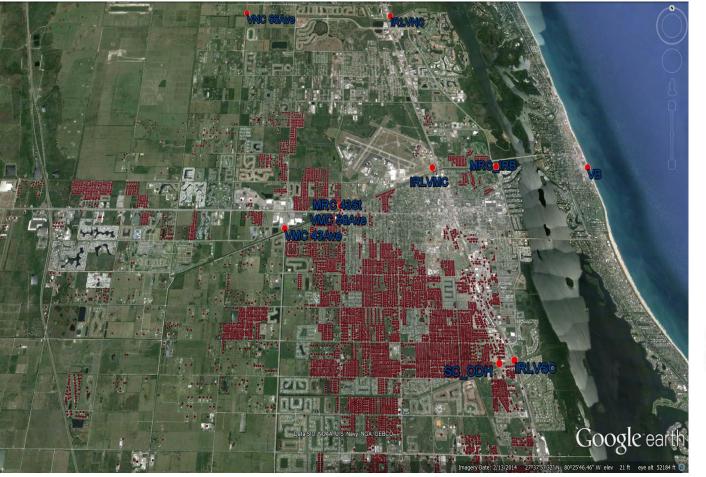

### **Hydraulic Conductivity**

## **Ground Water Level**

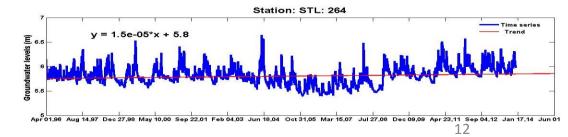

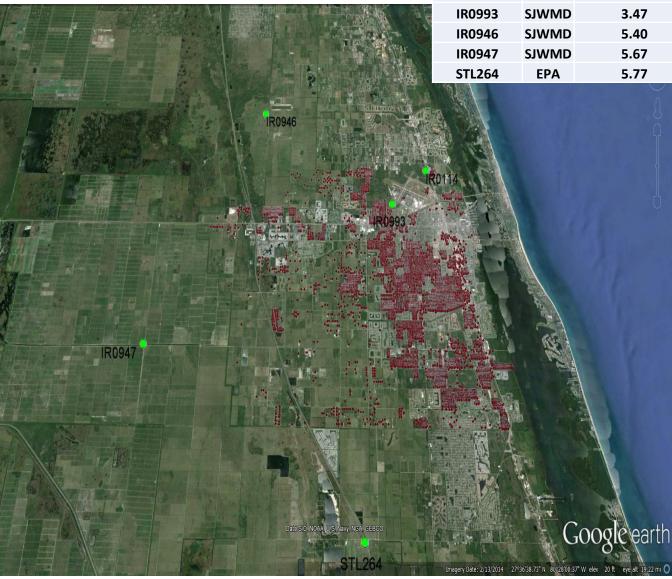

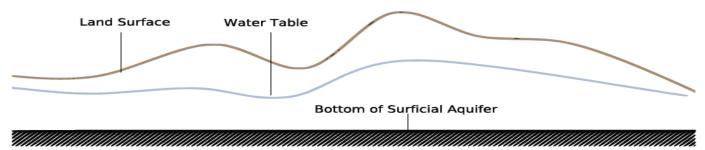

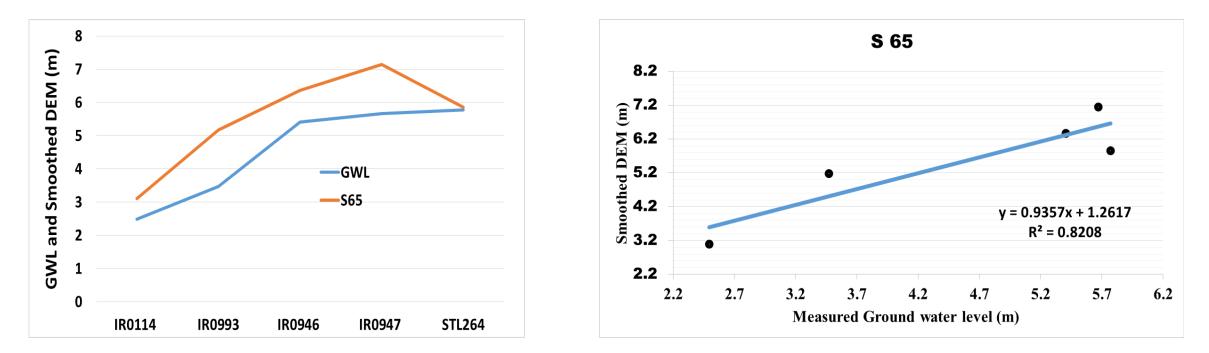

**Sources: SJRWMD** 

## Model Calibration Results: Heads

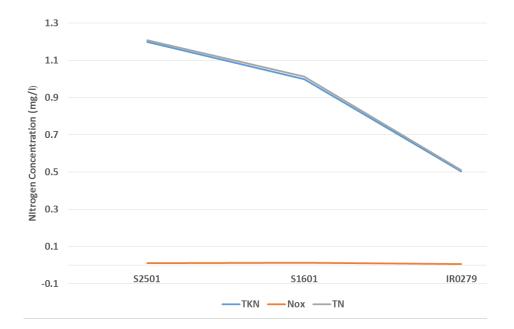

The smoothed DEM agrees well with the mean observed hydraulic head, because the correlation coefficient (0.90) and the slope of linear regression (0.94) are close to one.

## Ground water quality

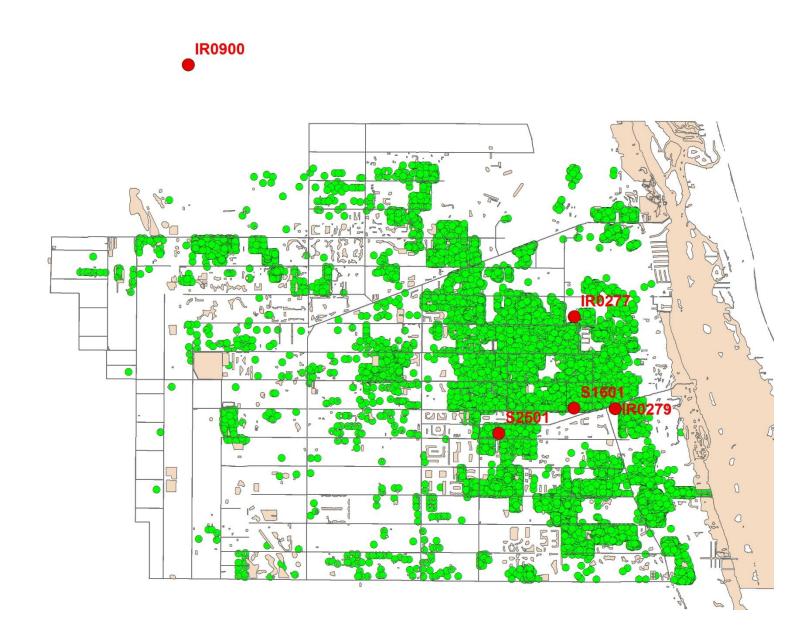

Data sources: James Sylvania, FDEP

Station number	Nitrate+Nitrite, Total (as N)	Ammonia+Organic Nitrogen, Total (as N)	TN
1601	0.0165	0.915	0.9315
IR0279	0.005	0.505	0.51
IR0277	0.0655	-	#VALUE!
2501	0.01	1.2	1.21
IR0900	-	1.2	#VALUE!

### **Transport model calibration:** Considerations of Well selection

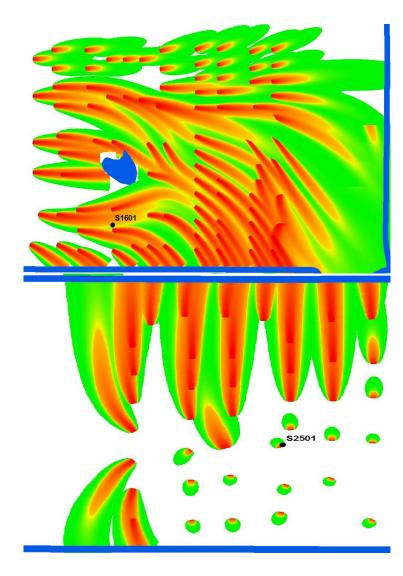

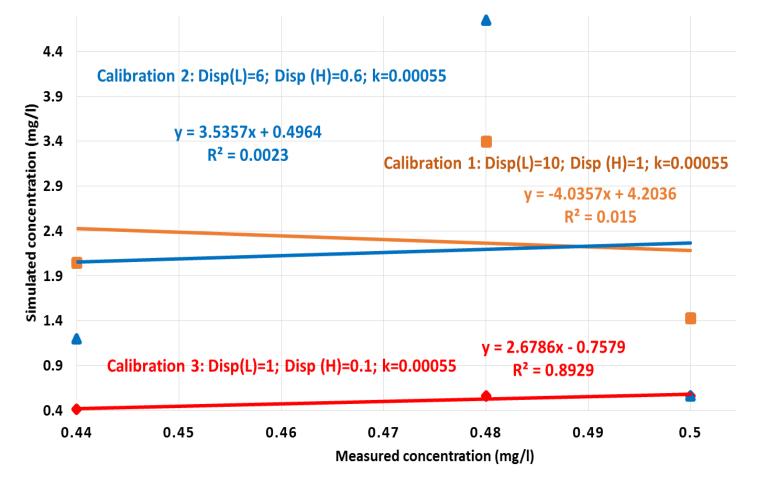

- Within our modeling area
- Monitoring well within the simulated plume
- Recent datasets with the availability of inorganic nitrogen parameters (NO-x and ammonia, total)

#### Monitoring well S2501 and S1601 satisfy

the above criteria, to move forward for transport parameters calibration

Plume concentration (mg/l), Two Wells (S1601 and S2501) and 3 sets of parameters calibration results

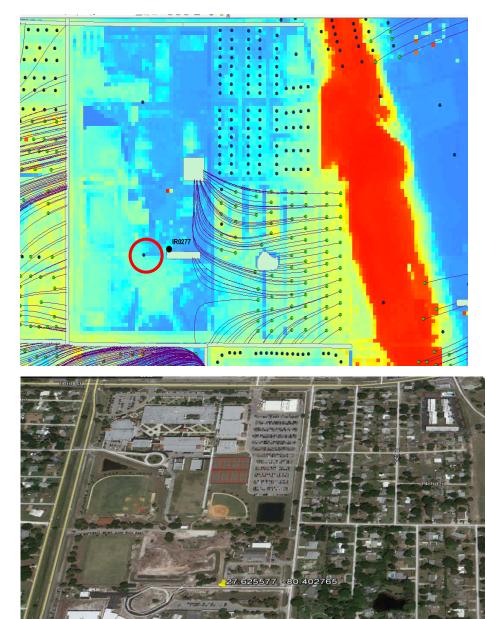

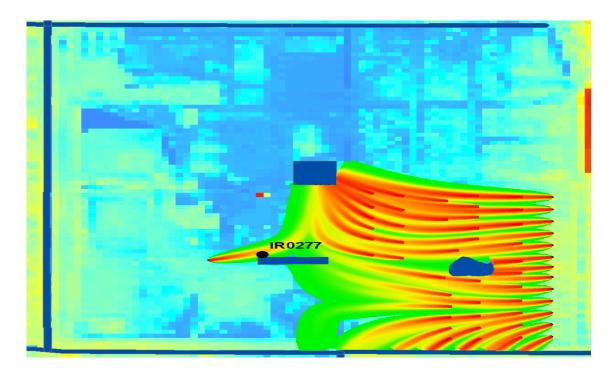

Two Wells (S1601 and S2501) and 3 calibration results

This plume based on the 3<sup>rd</sup> calibration, Disp(L)=1; Disp (H)=0.1; k=0.00055 /day

## Monitoring well IR0277

STATION_ NAME	COLLECTION_DATE	PARAMETER	VALUE (mg/L)
IR0277	04/28/1987	Nitrate+Nitrite, Total (as N)	0.031
IR0277	02/12/1991	Ammonia, Dissolved (as N)	0.37
IR0277	02/12/1991	Ammonia, Total (as N)	0.4
IR0277	02/12/1991	Nitrate+Nitrite, Total (as N)	0.10

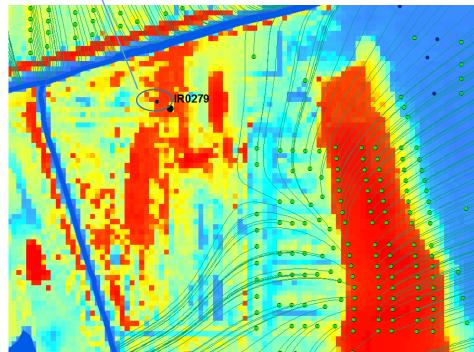

Transport parameters used: Disp(L)=1m; Disp (H)=0.1m; k=0.00055 /day

## Monitoring well IR0279

#### Removed septic

system

STATION NAME	COLLECTION_DATE	PARAMETER	VALUE (mg/L)
			,
IR0279	11/04/1998	Ammonia, Dissolved (as N)	0.39
IR0279	11/04/1998	Ammonia+Organic Nitrogen, Dissolved	0.52
IR0279	11/04/1998	Ammonia+ Organic Nitrogen, Dissolved	0.49

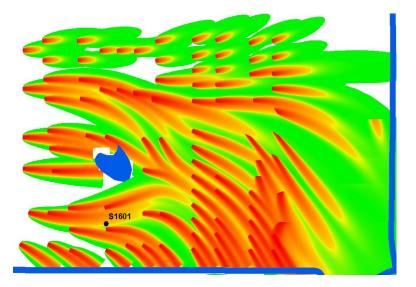

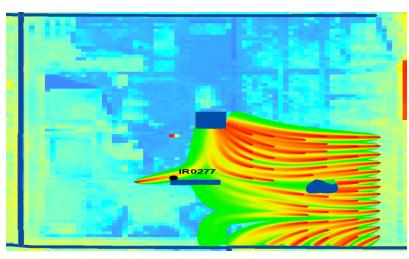

#### Google earth 2012

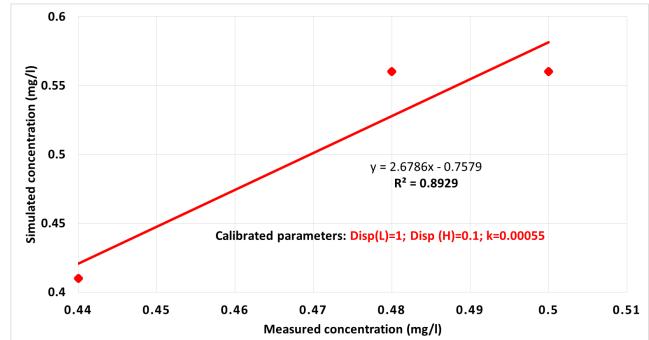

Google earth 1999

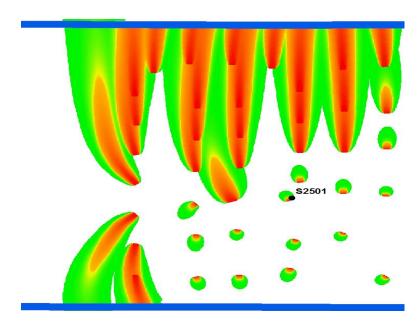

Yellow ribbon shows the well position

#### Calibration results of **3 wells (S1601, S2501 and IR 0277)**

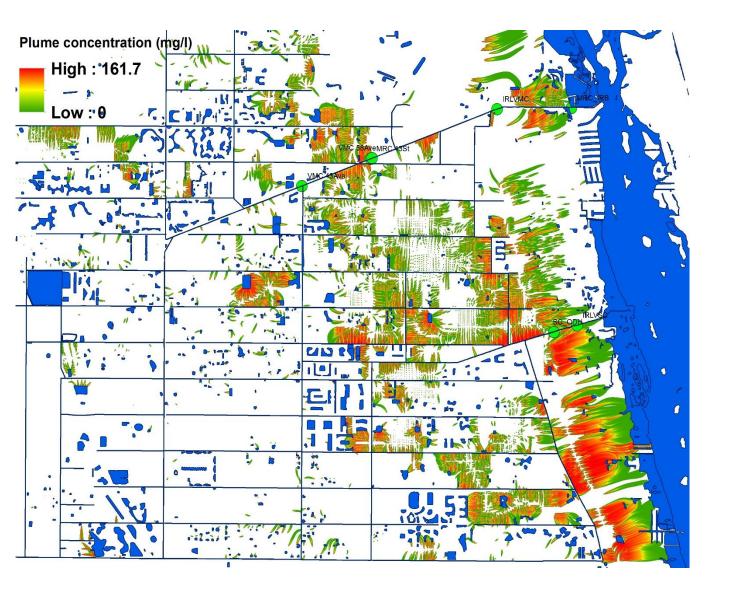

### Simulated Nitrogen Plumes

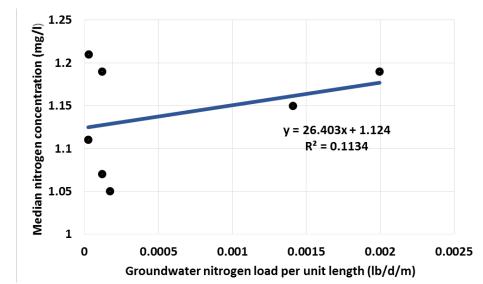

Total loads: **13742 lbs/yr** Main Canal drainage area: **4549 lbs/yr** South Canal drainage area: **8922 lbs/yr** 

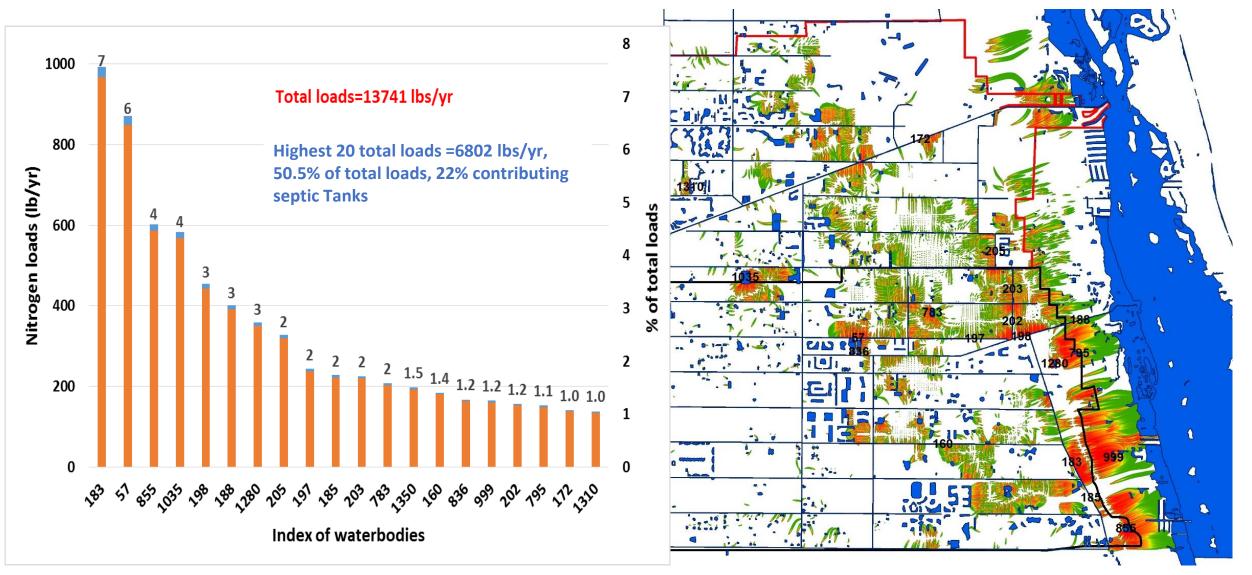

#### **Comparison:**

4.5% of BMAP, 2012 estimated TN load

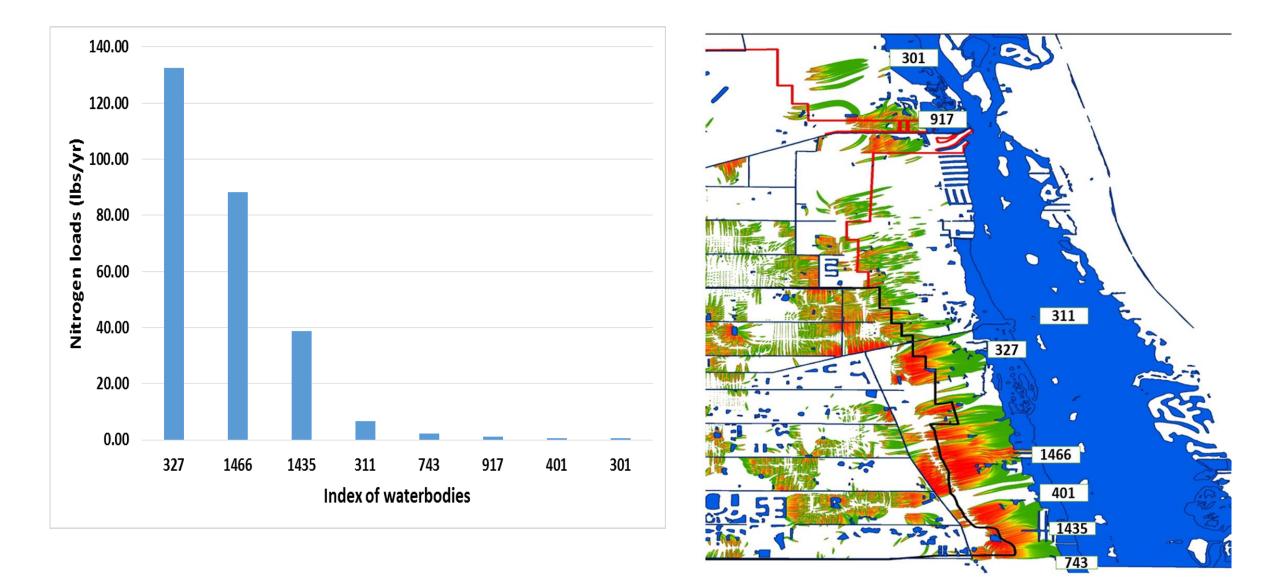

Septic systems contribute approximated 8.3 million pounds to the Bay, about 5% of the total nitrogen load (USEPA, 2013).

### **Highest 20 loadings in the Main-South basin area**

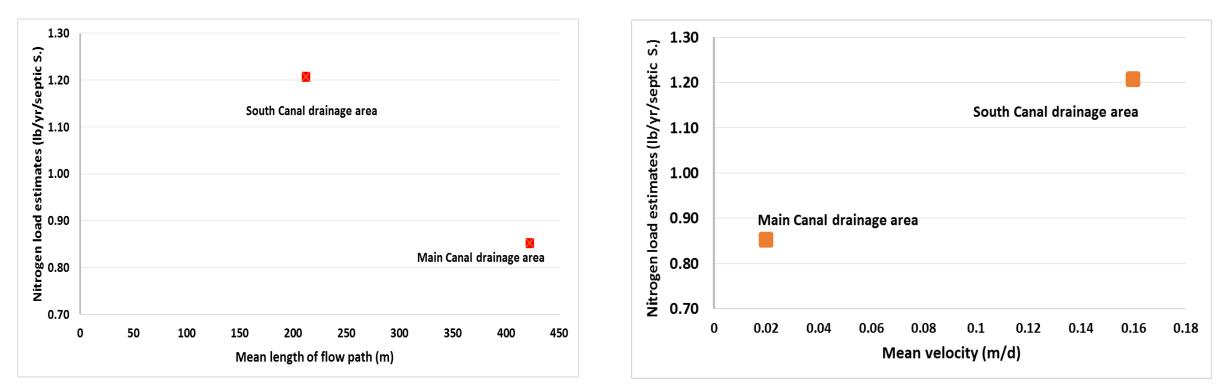

## Loadings to Lagoon

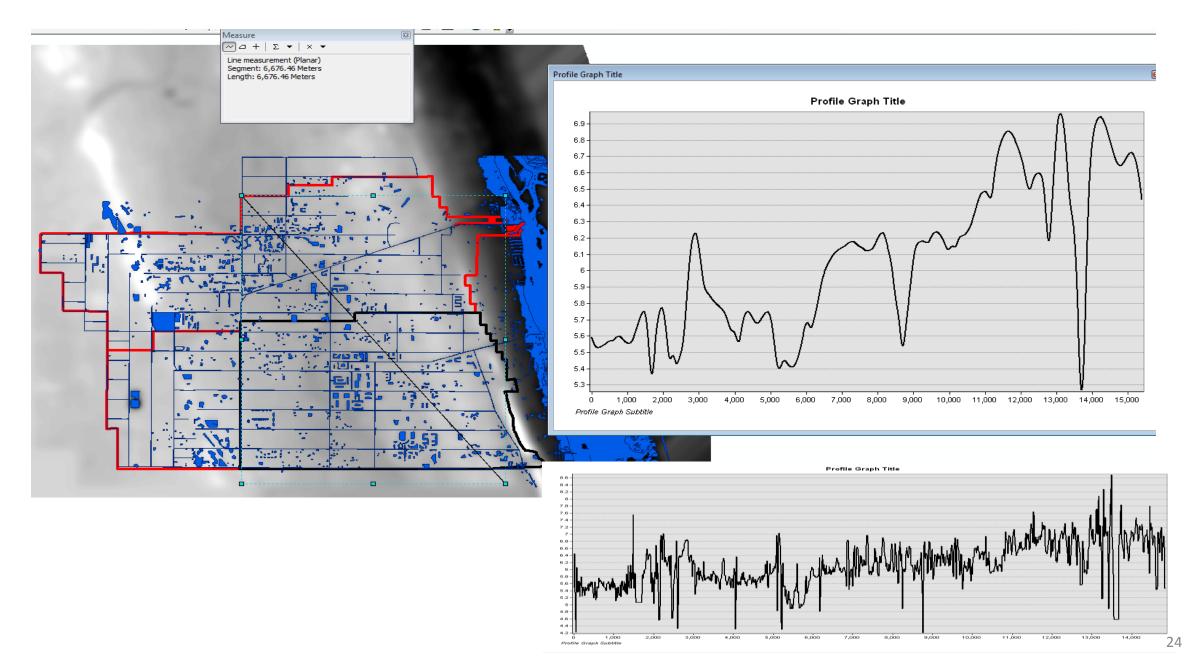

# Factors Controlling Load Estimate

- Mean length of flow path (left): long mean length of flow path corresponds to more denitrification and thus less load estimate.
- Mean velocity (right): larger mean velocity results in shorter travel time, less denitrification, and thus more load estimate.

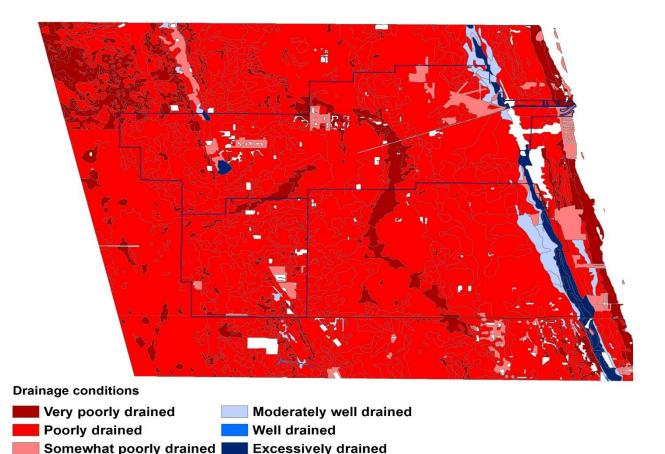

### Profile graph: smoothed DEM and Original DEM

## **Factors Controlling** Load Estimate.....(cont'd)

In the South-Main Canal area of IRC, high reduction ratio (90%) may occur because of the poor drainage condition over the area, because nitrogen transport is slower in poorly drained soil than in well-drained soil.

### Load comparison: BMAP, 2012 VS ArcNLET

#### TMDL Report: Indian River Lagoon Tributary DO and Nutrient TMDLs

### Four proposed positions of the monitoring wells for future calibration

# Future Work

- Collect the recent monitoring well data of hydraulic head and nitrogen concentration.
- Conduct model calibration and estimate nitrogen load in an iterative manner when new data arrives.
- Separate the nitrate and ammonium load estimation using the newly developed ArcNLET version.
- Evaluate the final load estimates and make management suggestions.

# Questions?
